

Adjustable Fuel Pressure Regulator

Installation Instructions for:
Part Numbers

25-300BK, 25-301BK, 25-303BK, 25-304BK

U.S. Patent # 6,298,828

WARNING:

Due to the fact that this installation deals with your fuel system this installation is not for the mechanically challenged! If you are not mechanically inclined or do not understand the procedure please do not attempt the installation. Refer the installation to a reputable mechanic.

ADVANCED ENGINE MANAGEMENT INC.

Part Number: 10-290

© 2000 Advanced Engine Management, Inc.

This part is legal in California for racing vehicles **ONLY** and should **NEVER** be used on public highways.

Congratulations! You have just purchased the finest adjustable fuel pressure regulator for your car at any price!

AEM billet aluminum adjustable pressure regulator.

The AEM adjustable regulator bolts directly to the stock Honda or the AEM high volume fuel rail. It is CNC machined from 6061 T-6 aluminum. The fuel outlet port is tapped to 9/16-18 threads, which allows the use of several different hoses ranging from the stock Honda fuel return hose to -8 AN hose. The vacuum reference is 1:1 ratio so for every pound of boost on a turbocharged or supercharged application yields a 1-pound rise in fuel pressure. The range of adjustability is from 20 PSI to the maximum the fuel pump can deliver.

Note: 1990-1993 Honda Accord and 1992-2000 Honda Prelude require the use of the *AEM Hi-Flow Fuel Rail* P/N 25-104. The AEM Adjustable Fuel Pressure Regulator can **NOT** be used with the stock fuel rail on these applications.

Note: Refer to attached table of applications to determine the correct *AEM Adjustable Fuel Pressure Regulator Kit* that is required for your year/model vehicle.

Read and understand these instructions **BEFORE** attempting to install this product

WARNING!!!

- Do not smoke while working on the fuel system.
- Keep open flames or sparks away from your work area.
- Be sure to relieve fuel pressure while engine is off.

Inline Base

Offset Base

Note: Honda uses two styles of fuel pressure regulator bases. Before proceeding with your installation please compare the fuel pressure regulator on your vehicle and your new AEM adjustable fuel pressure regulator with the above diagrams.

Note: 1990-1993 Honda Accord and 1992-2000 Honda Prelude require the use of the *AEM Hi-Flow Fuel Rail* P/N 25-104. The AEM Adjustable Fuel Pressure Regulator can NOT be used with the stock fuel rail on these applications.

Note: Refer to attached table of applications to determine the correct *AEM* Adjustable Fuel Pressure Regulator Kit that is required for your year/model vehicle.

1) Getting started

- a) Make sure vehicle is parked on a level surface.
- b) Set parking brake.
- c) **Disconnect the negative cable from the negative battery terminal.**
- d) If engine has run within the past two hours let it cool down.
- e) Clean the area on the fuel rail adjacent to the regulator.

Note: It is recommended to replace the washer between the service bolt and the special banjo bolt whenever the service bolt is loosened. (where equipped)

2) Relieving fuel pressure

- a) Remove the fuel fill cap.
- b) **On models equipped with a 6mm service bolt. (Illustrated below) If your vehicle is not equipped with a 6mm service bolt, proceed to step c.**
 - i) Use a box end wrench on the 6mm service bolt on top of the fuel filter, while holding the special banjo bolt with another wrench.
 - ii) Place a rag or shop towel over the 6mm service bolt.
 - iii) Slowly loosen the 6mm service bolt one complete turn.
 - iv) Leave service bolt loose until all pressure has been relieved.
 - v) Tighten service bolt to 10 lbf-ft.

c) **On models not equipped with a 6mm service bolt.**

- i) Use a box end wrench on the 12mm banjo bolt on top of the fuel filter.
- ii) Place a rag or shop towel over the 12mm banjo bolt.
- iii) Slowly loosen the 12mm banjo bolt one complete turn or until all pressure has been relieved.
- iv) Torque the 12 mm banjo bolt to 25 lbf-ft.

3) Stock fuel pressure regulator removal

- a) Place a rag or shop towel under the fuel pressure regulator return line.
- b) Disconnect the fuel return line at the bottom of the stock fuel pressure regulator.
- c) Disconnect the vacuum hose from the stock fuel pressure regulator.
- d) Place a rag or shop towel over the fuel pressure regulator.
 - i) Remove the two 6mm retaining bolts.
 - ii) Remove the fuel pressure regulator from the vehicle.

4) Installation of the AEM adjustable fuel pressure regulator

Note: The AEM fuel pressure regulator has the .100" orifice installed in the regulator and is set to 40psi. All adjustments of the pressure regulator will be explained in a later portion of the instructions.

WARNING!!!

The AEM adjustable fuel pressure regulator has been set to 40psi using a typical Honda fuel pump and a perfect running fuel system. Due to the differences on vehicle fuel pressure on different applications it is highly recommended that you adjust the fuel pressure on your vehicle. Refer to the last page of the instructions for the factory recommended fuel pressures.

- a) Remove and discard the two fuel pressure regulator caps used in packing.
 - i) Note: One cap is in the fuel inlet and one cap is on the fuel return.
- b) Install the fuel pressure regulator onto the fuel rail using the two allen bolts and washers supplied in the kit.

Make sure that the o-ring is replaced and properly installed between the regulator and the fuel rail.

 - i) Note: When installing the two allen head bolts a 5mm allen key should be used.
 - ii) Torque to 9 **lbf-ft**.
- c) Connect the vacuum hose to the top of the fuel pressure regulator. **On some vehicles incorporating a strut tower brace, it may be required to rotate the pressure regulator top to clear vacuum fitting.**
- d) Install the fuel return line fitting.
 - i) Use one crush washer when using the inline return fitting. Tighten to 20 **lbf-ft**. (Kits 25-300 & 25-301)
 - ii) Use two crush washers (one on each side of the fitting) when using the banjo angle return fitting. Tighten to 20 **lbf-ft**. (Kits 25-303 & 25-304)
 - (1) When using a kit with an angle return fitting, rotate the return nipple to match the fuel return line placement before tightening.
- e) Make sure that the rubber fuel return line is free flowing back to the fuel return hard line.
 - (1) Note: Ensure that there are no bends or kinks in the line that can restrict the fuel flow.
- f) Install any remaining components that were removed during disassembly.

5) Finishing touches

- a) Connect the negative battery terminal.
- b) Turn the ignition switch to the on position for approximately two seconds. **Do not operate the starter.** Then turn the ignition switch to the off position.
- c) Repeat this procedure three times, and then check all components that were removed during installation for any signs of fuel leakage.
- d) If there are signs of leakage you **MUST** correct the leak before proceeding.
- e) If there are no signs of leakage, then start engine and again check for leaks. If there is any sign of leaking you **MUST** repair the leak before driving the vehicle.
- f) **Note: To check the fuel pressure, start the engine. Measure the fuel pressure with the engine idling and vacuum hose of the fuel pressure regulator disconnected from the fuel pressure regulator and pinched. Set the AEM adjustable fuel pressure regulator to recommended settings on the last page of the instructions.**

6) Pressure and orifice adjustments

Note: The AEM adjustable fuel pressure regulator can be fine tuned for your application. These adjustments will be covered in this section. A fuel pressure gauge needs to be used for precise tuning.

- a) When fuel pressure adjustments are to be made, loosen the jam nut on the top of the AEM fuel pressure regulator and either tighten or loosen the set screw.
 - i) When loosening the jam nut a 3/8" wrench should be used.
 - ii) When tightening or loosening the set screw a 3/32" allen key should be used.
 - (1) To increase fuel pressure turn the set screw in a clockwise rotation.
 - (2) To decrease fuel pressure turn the set screw in a counter-clockwise rotation.

- b) When orifice changes are to be made, remove the fuel pressure regulator using the steps in section 4 in reverse order. When this is completed, remove the six bolts from the top of the fuel pressure regulator and use a 3/8" socket to remove the orifice in the regulator and replace with a different size orifice.
- i) When removing the six bolts from the top of the fuel pressure regulator a 9/64" allen key should be used.
 - (1) Torque to 24 **lbf-in**.
 - (2) There is a constant pressure applied to the diaphragm by the spring inside the fuel regulator make sure parts do not get lost upon removal of these bolts.
 - ii) When ever the regulator is disassembled check the diaphragm for any wear and tear, which may cause a fuel pressure problem.
 - (1) If the diaphragm is damaged contact AEM to purchase a replacement diaphragm.
 - iii) When removing the orifice a 3/8" socket should to be used.
 - (1) Note: **Be careful not to scratch or damage the surface of the orifice in any way, as it is a precision ground surface for the diaphragm to seal on.**
 - (2) Torque to 10 **lbf-ft**.
 - (3) There are three different size orifices supplied in the AEM fuel pressure regulator kit, which are indicated by three different colors. Black = .100" Silver = .150" Gold = .200"
 - (4) Upon re-installation of the orifice use a light coat of oil on the threads to prevent galling.
 - iv) Re-assemble the fuel pressure regulator. Assembly diagram at the end of the instructions.

**Shown below is a typical installation picture that can be used for reference.
Other applications are similar.**

Regulator Part #	Straight or Angle Return	Vehicle	Year	Model	Rec. Fuel Press
25-300	Straight	Integra	94-2000	RS, LS, GS	40-47 PSI
25-300	Straight	Integra	94-2000	GSR, Type-R	48-55 PSI
